publik.

Fuck software subscriptions.

Free software, made usable. Iris installs, fixes and adapts it.

We made paid software free. Both sides showed up.

Open source is inaccessible.

Software user

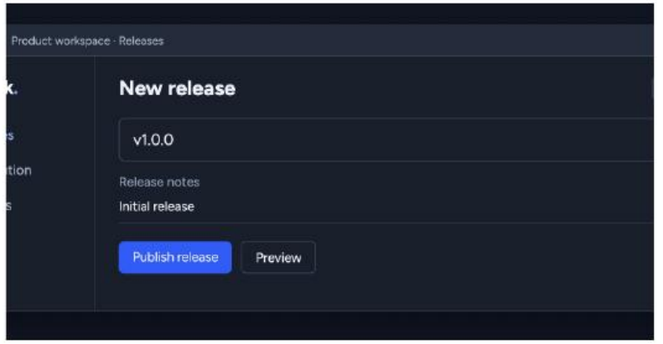

Needs usable software.

Installing, maintaining and adapting a repository still takes technical work.

The missing loop

- Setup stays technical
- Bugs arrive without context
- Improvements stay disconnected
- Maintenance falls to the user
- Distribution starts at zero

Builder

Needs users.

AI can write code. Real use and ongoing maintenance turn a project into a company.

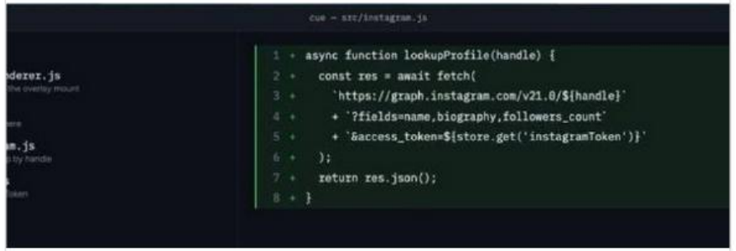

Feedback rarely becomes software.

Iris changes the product. Publik gives it a market.

01 Create

Start with an idea

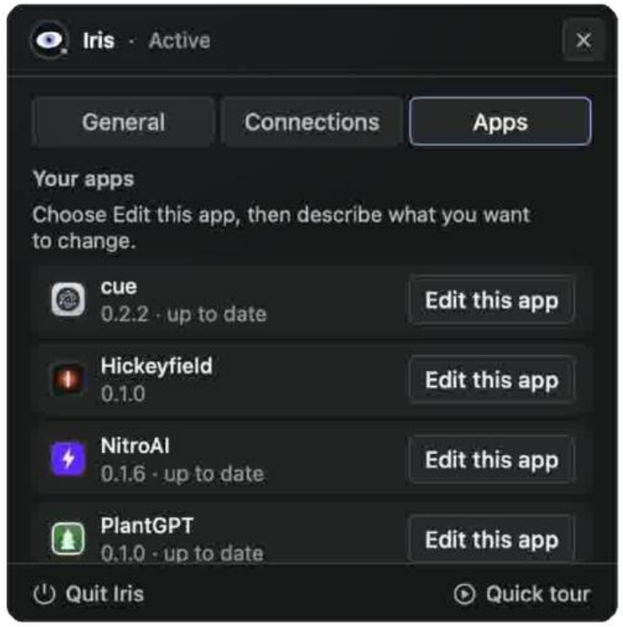

Turn a useful workflow into software.

- Iris writes the starting point

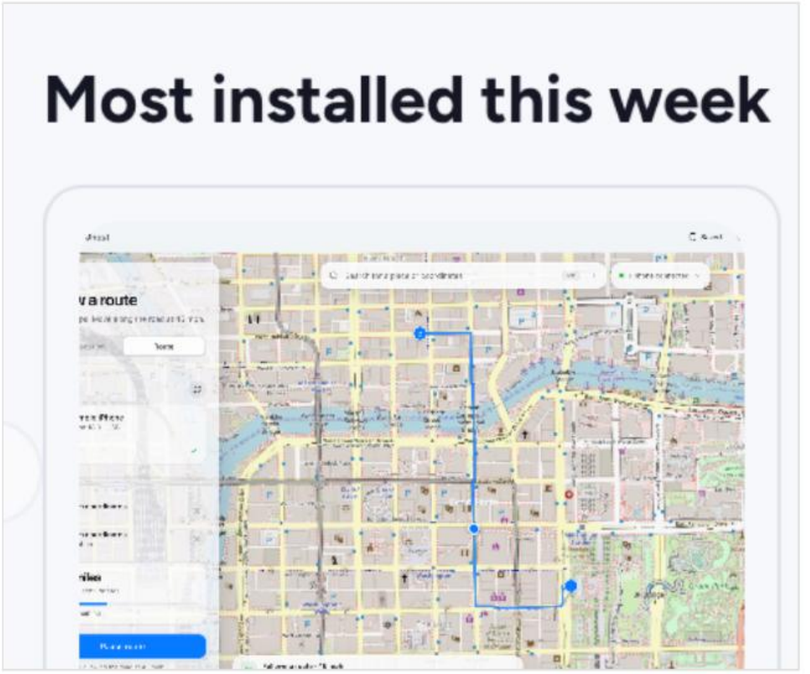

Describe what you want to build.

02 Adapt

Adapt the apps you already use.

03 Distribute

Publish where users already browse.

Meet Iris.

Build, fix and adapt software on your desktop.

Meeting notes for a team

Based on Oatmeal, a Publik-listed app

Enterprise buyer → Software license

Builder + Publik share the sale.

Standalone apps charge for software. We charge for usage.

Primary product scope	Publik	Standalone app	GitHub	Lovable	Claude Code	Product Hunt
Who it is for	Consumers	Consumers	Developers	Prosumers	Developers	Early adopters
Open source	Yes	No	Yes, raw	No	No	Mixed
What the user pays	API cost + small fee	Monthly subscription	Free, if you can code	Subscription	Subscription	Nothing
Getting it working	Iris installs it	Ready-made	Manual setup	You build it	You wire it up	Just a link
Adapts to each user	Iris edits your copy	Fixed for everyone	Manual fork	Builder-led	User-directed	Beyond core focus
Builder earns	50% of usage	Owns the app	Nothing	Nothing	Nothing	Nothing

Standalone apps charge for the software itself. We charge API cost plus a small fee, so the same work costs the user less. GitHub and Lovable sit in the prosumer middle that coding agents are absorbing.
